

Custom template catalogs

The quickest and easiest way to generate new sites

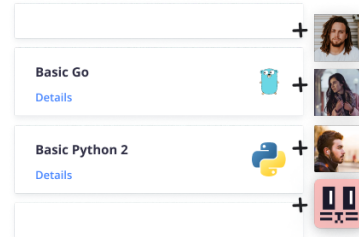

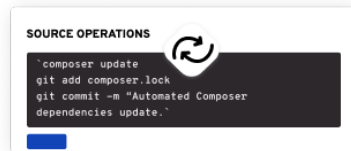

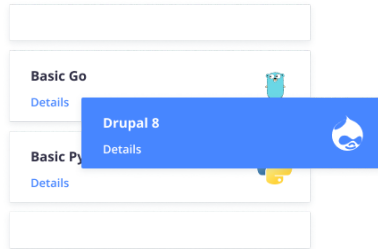

Do you have a specific microsite design you use to promote new campaigns? Do you have a family of applications all built from the same framework? Does each of your brand sites have its own design look?

Platform.sh has a comprehensive library of custom template catalogs. Define premade application templates around your common use cases, and then use them to generate new sites in minutes.

With custom template catalogs, you can:

- + Invest in delivering features and new applications—not in reinventing the wheel.
- + Use the tools and frameworks your teams need—without costly re-architecture.
- + Dramatically improve security by having custom applications your security team has already vetted and reviewed.
- + Run across multiple regions and clouds.

Three, two, one . . . launch!

Step 1: Format an application template to initialize your Platform.sh projects.

Step 2: As an option, you can choose to include a Source Operation in your template. These automated scripts will be cloned into each child project.

Step 3: Share your application templates with your TAM, who will create and host a custom template catalog in your Platform.sh console.
